Ouestion 3

Objective The fundamental data types in clare int. float and char. Today, we're discussing int and float data types. The printf() function prints the given statement to the console. The syntax is printf("format string".argument list);. In the function, if we are using an integer, character, string or float as argument, then in the format string we have to write %d (integer), %c (character), %s (string), %f (float) respectively. The scanf() function reads the input data from the console. The syntax is scanf("format string", argument list);. For ex: The scanf("%d", &number) statement reads integer number from the console and stores the given value in variable number To input two integers separated by a space on a single line, the command is scanf("%d %d", &n, &m), where n and m are the two integers. Task Your task is to take two numbers of int data type, two numbers of float data type as input and output their sum: Declare 4 variables: two of type int and two of type float. Read 2 lines of input from stdin (according to the sequence given in the 'Input Format' section below) and initialize your 4 variables.

Use the + and - operator to perform the following operations:

	Input	Expected	Got	
~	10 4 4.0 2.0	14 6 6.0 2.0	14 6 6.0 2.0	~
~		28 12 12.0 4.0	The Later	~
